EXAMINER'S AMENDMENT

1. An Examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to Applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

IN THE CLAIMS:

A) Amend the claims 17, 22, 26, and 32 as follows;

17. (Currently Amended) A system for communication of video information over a network, comprising:

a first object-oriented coder that divides data into object macroblocks and background macroblocks, the object macroblocks and background macroblocks being a portion of partitioned-video data that is transmitted at a bit-rate, and that assigns a higher number of error control overhead bits to the object macroblocks than to the background macroblocks based on a threshold of the bit rate of the partitioned-video data, wherein the first object-oriented coder further configured to evaluate whether the bit-rate of the partitioned-video data is less than a bit rate of nonpartitioned-video data and assigns a higher number of error control overhead bits to the object macroblocks than to the background macroblocks when the bit rate of the partitioned-video data is less than the bit rate of the nonpartitioned-video data.

22. (Currently Amended) A method for communicating video information over a network, comprising the steps of:

dividing data into object macroblocks and background macroblocks, the object macroblocks and background macroblocks being a portion of partitioned-video data that is transmitted at a bit-rate;

assigning a higher number of error control overhead bits to the object macroblocks than to the background macroblocks based on a threshold of the bit rate of the partitioned-video data;

evaluating whether the bit-rate of the partitioned-video data is less than a bit rate of nonpartitioned-video data; and

assigning a higher number of error control overhead bits to the object macroblocks than to the background macroblocks when the bit rate of the partitioned-video data is less than the bit rate of the nonpartitioned-video data.

26. (Currently Amended) A system for communicating video information over a network, comprising:

means for dividing data into object macroblocks and background macroblocks, the object macroblocks and background macroblocks being a portion of partitioned-video data that is transmitted at a bit-rate;

means for allocating a higher number of error control overhead bits to the object macroblocks than to the background macroblocks based on a threshold of the bit rate of the partitioned-video data;

means for evaluating whether the bit-rate of the partitioned-video data is less than a bit rate of nonpartitioned-video data; and

means for assigning a higher number of error control overhead bits to the object macroblocks than to the background macroblocks when the bit rate of the partitioned-video data is less than the bit rate of the nonpartitioned-video data.

32. (Currently Amended) A computer readable medium having a computer program for communicating video information over a network, the program performing the steps of:

dividing data into object macroblocks and background macroblocks, the object macroblocks and background macroblocks being a portion of partitioned-video data that is transmitted at a bit-rate;

Art Unit: 2613

assigning a higher number of error control overhead bits to the object macroblocks than to the background macroblocks based on a threshold of the bit rate of the partitioned-video data;

evaluating whether the bit-rate of the partitioned-video data is less than a bit rate of nonpartitioned-video data; and

assigning a higher number of error control overhead bits to the object macroblocks than to the background macroblocks when the bit rate of the partitioned-video data is less than the bit rate of the nonpartitioned-video data.
